PT for production of spiramycin-related polyketide antibiotics

DNA encoding Streptomyces ambofaciens platenolide synthase domain -

For production of spiramycin-related polyketide antibiotics

This sequence represents the platenolide synthase gene cluster of the cinvention. This sequence is referred to as the srm6 gene, and was consolated from Streptomyces ambofaciens. This sequence encodes the nutri-functional proteins which direct the synthasis of the polyketide platenolide. Platenolide is the basic building block of the macrolide pribiting antibiotic activity based on the platenolide structure, including specifically the macrolide antibiotic spiramycin and spiramycin consumptions of the platenolide synthase DNA sequence can be made so as to change the number and type of carboxylic codes incorporated into the growing polyketide chain and to change the consumer 44377 BP; 4965 A; 15552 C; 17381 G; 6479 T;

Distriction of tylosin-related polyketide compounds

Frought According Streptomyces fradiae tylactone synthase domain - for

production of tylosin-related polyketide compounds

Example 2; Pages 110-134; 200pp; English

This sequence represents the platenolide synthase gene cluster of the

This sequence is referred to as the srmd gene, and was

considered from Streptomyces ambofaciens. This sequence encodes the

multi-functional proteins which direct the synthesis of the polyketide

platenolide. Platenolide is the basic building block of the macrolide

antibiotic spiramycin. This sequence was used along with the tyld gene

(see T80413) to create a hybrid ORTS sequence (see T80415). The tyld gene

(see T80413) to create a hybrid ORTS sequence (see T80415). The tyld gene

(see T80413) to create a hybrid ORTS sequence (see T80415). The tyld gene

(see T80413) to create a hybrid ORTS sequence (see T80415). The tyld gene

(see T80413) to create a hybrid order cluster of the invention. The tyld gene

(see T80413) to create a hybrid order cluster of the invention. The tyld gene

(see T80413) to create a hybrid order cluster of the invention. The tyld gene

(see T80413) to create a hybrid direct the synthesis of the polyketide

(tylosin. The hybrid sequence can be used to transform 5. ambofaciens

(accuence, so that they can produce polyketides. The DNA sequence can be

modified so as to alter the type of carboxylic acids incorporated, the

number of carboxylic acids incorporated and/or the post-condensation

(accuence) the condensation of carboxylic acids incorporated and/or the post-condensation

(accuence) the condensation of carboxylic acids incorporated and/or the post-condensation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ŧ,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 6419

Tale 19 3: 48pp; English.

A BCG DNA fragment (T04154) that complemented a dapB mutation in Escherichia coli was isolated. The BGC dapB gene encoded a bifunctional enzyme (R789946) capable of catalyzing the dihydrodipicolinate-reductase and diaminopimelate-dehydrogenase reactions involved in diaminopimelic acid (DAP) biosynthesis. DAP biosynthetic genes are useful as targets for anti-mycobacterial agents and for the design of in vivo selection systems. Mycobacteria having a deleted dapB gene can be used for vaccine produ.

Example 18: Column 135-144; 8Bpp; English.

This genomic DNA sequence encodes a cluster of genes involved in phenazine biosynthesis. Phenazines are nitrogen-containing heterocyclic compounds with a common planar aromatic tricyclic structure. It has been proposed that phenazine antibiotic function arrises from the formation of intercalative complexes with DNA interfering with DNA metabolism. Transgenic plants containing such antipathogenic genes should have enhanced resistance to attack by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Van Pee K;

pseudomonas aureofaciens. This sequence was used to isolate the pyrrolnitrin gene region of the invention, that encodes at least one enzyme required in the biosynthetic pathway of pyrrolnitrin. The DNA and host cells transformed with it are useful for the production of transgenic plants with protection against phytopathogens. The enzymes substances (APS). The compound ulfimately plant antipathogenic fungal respiratory electron transport and causes general lipoprotein damage. The transformed cells can additionally be used in compositions to be applied to plants to provide resistance, as can purified APS produced by them Transgene dependent resistance eliminates the need to spray crops with chemical based pesticides and antibiotics, which is expensive and time consuming, and in addition, especially in the case of antibiotics, their over use leads to resistance. In addition, transgenic production of these enzymes overcomes problems of applying micro-organisms which can be slow growing and isolated in their growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pseudomonas fluorescens phenazine gene cluster.

The strains can be acterial and microflora in the plant rhizosphere. The strains can be included with agronomically acceptable carriers or chemical fungicides (e.g. metalaxyl compounds) in biocontrol compositions. The strains or compositions can be applied to a plant/plant part to protect it from a plant pathogenic fungus, by controlling or inhibiting fungal growth. They can also be applied to the environment in which a plant pathogenic fungus will grow (e.g. soil) to similarly control or inhibit pathogenic fungus. They are especially effective against plant pathogenic fungus. They are especially effective against conton. Rhizoctonia also infects many other crop species (e.g. beans and wheat), and no effective chemical fungicides are available. The present sequence represents the Pseudomonas fluorescens phenazine gene cluster used in an example from the present libé A; 1855 C; 1677 G; 1000 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         125-JUN-1999 (first entry)

X51787 to X52019 represent 5° expressed sequence tags (ESTs) for human secreted proteins, and encode the proteins given in Y12987 to Y13219, respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation/differentiation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated brain-derived nucleic acids - used to develop products
             WPI; 98-33337/29.
Genetically modified Pseudomonas strains - useful to protect crop plants by controlling or inhibiting plant pathogen growth, e.g. growth of Rhizoctonia species

/note= "these bases represent a line of missing text in
/note= "the sequence listing in the specification. They
are included to maintain the nucleotide numbering
given in the specification for this DNA sequence"
activity, haematopoiesis regulating activity, tissue growth regulating activity, reproductive hormone regulating activity, chemotactic/ chemotactic activity, haemostatic and thrombolytic activity, receptor/ ligand activity, anti-inflammatory activity, tumour inhibition activity or or or cher activities. The products can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or sequence 278 BP; 95 A; 56 C; 58 G; 67 T;

The present sequence represents a bacterial artificial chromosome (BAC) contig, and exemplifies the invention. The specification describes nucleic acid sequences derived from a eukaryotic chromosome, including a nucleic acid sequences derived from a eukaryotic chromosome, including a compatible cell, of replicating, acting as extra-chromosome lelement a compatible cell, of replicating, acting as extra-chromosome lelement and segregating during cell division. The sequences can be used to construct artificial chromosomes for use in gene therapy comprising a replicable, segregating nucleic acid that confers a specific phenotype on cells. Human artificial chromosomes can propagate in human cells and carry large amounts of DNA (e.g. therapeutic genes), and, being extra-chromosomal, they are not mutagenic. The artificial chromosomes can production of proteins and to make diagnostic reagents, e.g. for expression of cytokines, receptors and growth factors, or to increase the copy number of a gene in a cell. The constructs may also be used for functional and structural analysis of chromosomes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   70-00-1995.

/*tag- a /note- "Residue not given in the specification, included to maintain open reading frame and to encode the amino acid given in the specification at this
immunoreactive with n-(ABCDE) serum. Inserted sequences in gtll
c are expressed as beta-galactosidase fusion proteins. Clone 4B11
has 3 multiple insert sequences; each insert can be fractionated
into discrete sequences by restriction enzymes, or portions of the
inserts can be PCR amplified by sequence specific primers. Each
resulting individual region can be subcloned and immunostreened.
This allows identification of specific regions responsible for
immunoreactivity. n-(ABCDE) hepatitis virus polypeptides can be
used for the production or detection of antibodies, and in
vaccines. The antibodies can be used for detection, diagnosis and
in passive immunotherapy. The DNA can be used in detection and
diagnosis, and as hybridisation probes for identification of
further n-(ABCDE) hepatitis virus coding sequences. Culture systems
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Disclosure: Columns 61-64; 52pp; English.
The sequences given in T34189-90 encode proteins from the pentachlorophenol (Pcp) breaddown pathway, designated Pcpb and Pcpt. The Pcpb gene was found to code for a 323 amino acid polypeptide, mol. wt. 35942 daltons. Based on multiple sequence alignments, Pcpb belongs to the family of class I dioxygenase electron transport proteins. Pcpb was predicted to have three structural
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PcpD coding sequence.

comains, one involved in binding flavin mononucleotide (FMN), the second responsible for binding reduced NADPH and the third forming a plant-flaved contrype (ZPE-ZS) centre. PcpD is classified as an iron sulphur flavoprotein-oxidoreductase, and has been designated the PCP 4-monooxygenase reductase. It is transcribed as a dicistronic message with PcpB (see also T14184). The pcpR open reading frame encodes a 303 amino acid protein with a mol. Wt. of 33549 daltons, which possesses a helix turn helix motif in its N-terminal portion. PcpR is thought to activate the transcription of pcpBD and pcpA. In combination with pcpA, pcpB and pcpC, these enzymes catalyse the initial steps of PCP breakdown. These enzymes can specifically be used in the breakdown of PCP containing matter which persists in the environment and in food chains pesticide, and in products such as herbicides and disinfectants.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          restricted P. aeruginosa waaC, waaG, waaF and waaP gene cluster vesful in the diagnosis or treatment of P. aeruginosa infections claim 2; Fig 6; 6ipp; English.

This is the nucleotide sequence of the waaF gene (rfaF gene) of the waa gene cluster of Pseudomonas aeruginosa PAO1. It codes for WasZell), a heptosyl transferase II that adds the second heptose residue onto the core oligosaccharide in the biosynthesis of the propolysaccharide inner core. The four waa genes of P. aeruginosa (see V84116-19) are arranged contiguously in an operon with the gene order waaF, waaC, waaG and waaP. The functions of the encoded proteins (see W82210-13) were tested by complementation of specific Salmonella typhimurium mutants, and knockout mutations of the genes in P. aeruginosa. The waa nucleic acids or proteins can be used to diagnose a bacterial, especially a P. aeruginosa. Infection in an animal. They can further be used to screen for compounds that affect core lippopolysaccharide biosynthesis or assembly. A claimed method of treating or preventing a bacterial infection in comprises administering an agent that inhibits a waa gene to naminal. A claimed wack, waaG, waaG, as a seambly. It currently consists of 6 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Center project name: 12959

On Nov 27, 1999 plis sequence version replaced g1:6066017.

IMPORTARY: This sequence is unfinished and does not necessarily
represent the correct sequence. Work on the sequence is in progress and the release of this data is based on the understanding
that the sequence may change as work continues. The sequence may
be contaminated with foreign sequence from E.coli, yeast, vector,
phage etc. Order of segments is not known; 800 n's separate
segments. Contig_ID: 00008 Length: 1036bp

Homo sapiens chromosome 12p13 clone RPCIII-946L16, *** SEQUENCING IN PROGRESS ***, 34 unordered pieces.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        NOTE: This is a 'working draft' sequence. It currently consists of 7 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

* NOTE: This is a "working draft" sequence. It currently

* Consists of 34 contigs. The true order of the pieces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.

of Mycobacterium leprae
Mol. Microbiol. 7 (2), 197-206 (1993)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             in codons is given for each CDS.
Usually the highest scoring match found by fasta -o is given for
CDS which show significant similarity to other CDS in the database.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Etudes des Genomes (GIP-GREG).
Details of M. Leprae sequencing at the Sanger Centre are available on the World Wide Web.

The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon. All CDS over 100 codons have been analysed. Gene prediction is based on positional base preference in codons especially where there is an increase in the observed/expected third position G + C. CAUTION: We may not have predicted the correct initiation G + C. CAUTION: We may not have predicted the correct initiation odon. Where possible we choose an initiation codon (aty, gtg, or ttg) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon. If this cannot be identified we choose the most upstream initiation codon.

IMPORTANT: This sequence MAY NOT be the entire insert of the sequenced clone. It may be shorter because we only sequence overlapping sections once, or longer, because we arrange for a incation/qualifiers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GTGLFLGAGGRIAKAGPGLFLVYAVCGVFVFLILRALGELVLHRPSSGSFVSYAREFF

permease, len: 505 aa; highly similar to many amino-acid permeases e.g. ANSP_SALTY (EMBL:004831) S.typhimurium AnsP, L-asparagine permease (L-asparagine transport protein) (497 aa), fasta scores: 1891 z-score: 2218.9 E(): 0, 58.9% identity in 477 aa overlap. Equivalent to M.tuberculosis Rv2127 (MTCY261.26, 83.7% identity in 485 aa overlap). Also similar to M.tuberculosis permease Rv0446c (MTCY18E10.06c, 69.8% identity in 473 aa overlap). Probable integral membrane protein, contains PS00218 Amino acid permeases signature. Pfam match to entry PF00324 aa_permeases, amino acid permease. Annotated as ORF 7R:049802, designated lysp in M.leprae cosmid EMBL:00017"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           complement(2903. .3856)

For further information about this sequence, including its location and relationship to other sequences, please visit our sequence archive Web site (http://www.fruitfly.org/sequence/) or send email to bdgp@fruitfly.berkeley.edu All contigs in this submission meet the following cutoffs: length >= 200 bases. It currently * consists of 99 contigs. The true order of the pleces * is not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Celniker, S.E., Agbayani, A., Arcaina, T.T., Baxter, E., Blazej, R.G., Celniker, S.E., Agbayani, A., Arcaina, T.T., Baxter, E., Blazej, R.G., Butenhoff, C., Champe, M., Chavez, C., Chew, M., Ciesiolka, L., Doyle, C.M., Farfan, D.E., Galle, R., George, R.A., Harris, N.L., Hoskins, R.A., Hummasti, S.R., Karra, K., Kearney, L., Kim, E., Lee, B., Lewis, S., Li, P., Lomotan, M.A., Mazda, P., Moshrefi, A.R., Moshrefi, M., Nixon, K., Pacleb, J.M., Park, S., Pfeiffer, B., Poon, L., Sequeira, A., Sethi, H., Snir, E., Svirskas, R.K., Wan, K.H., Weinburg, T., Zhang, R., Zieran, L.L. and Rubin, G.M.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

8 Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

**NOTE: This is a 'working draft' sequence. It currently consists of 89 contigs. The true order of the pleces

** is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as ** runs of N, but the exact sizes of the gaps are unknown.

** This record will be updated with the finished sequence as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            **
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           seq_documentation_block:

SEQUENCING READ COVERAGE:Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.
           STSS are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.
                                                                                                                                                                                                                                                                                                                                                                                                                              QUALITY OF INDIVIDUAL BASES:This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases.

Standards of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found at URL: http://gc.bcm.tmc.edu:8088/quality.info/genbank.annotation.

CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the

Overlapping clone Features listing.

ON Nov 15, 1999 this sequence version replaced gi:605524.

IMPORTANT: This sequence is unfinished and does not necessarily represent the correct sequence. Work on the sequence as in progress and the release of this data is based on the understanding that the sequence may change as work continues. The sequence may be contaminated with foreign sequence from E.coll, yeast, vector, phage etc. Order of sequence is not known; 800 n's separate sequences. The synthetic immunoglobulin binding proteins derived from protein L comprise repeated sequences from protein L which bind immunoglobulin Kappa light chains. They can be used in protein analysis, purification procedures and other biochemical processes e.g. ELISA. The synthetic molecules are of particular advantage if they are free of regions in protein L which exhibit albumin and cell wall binding (The repeat regions commencing at nucleotide numbers

07-ocr-1996 (first entry)
Mutated BRCAl genomic sequence from sample set MSKCC family 19921.
Cancer therapy, breast and ovarian cancer predisposing gene; immunogen; antibody production; germline alteration; probe; lesion neoplasis; human; gene therapy; protein replacement therapy; protein mimetic; BRCAl; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ħ
                                                                                                                                                                                                                                                                                                                                                                                      Immunoglobulin binding polypeptide, protein L - used for prodn. of pharmaceuticals and for immobilising antibodies e.g. on columns, in diagnostic tests and in assays
bisclosure; Figure 1: 29pp; English.
Protein L forms a complex with immunoglobulin Kappa light chain. Purified protein can be used as a reagent for immobilising antibodies e.g. on columns, in diagnostic tests and in assays.
may also be used in the production of pharmaceuticals. Sequence 3279 BP; 1505 A; 480 C; 626 G; 668 T;
